

# General Principles and Processes of Isolation of Elements Important Questions With Answers NEET Chemistry 2023

1.	<ol> <li>During the process of electrolytic refining of c</li> </ol>	opper, some metals pre	esent as impurity settle a	as anode mud: These
	are:			

a) Sn and Ag b) Pb and Zn c) Ag and Au d) Fe and Ni

#### Solution: -

In the electrolytic refining of copper the more electropositive impurities like Fe, Zn, Ni, Co, etc. dissolve in the solution and less electropositive impurities such as g, Au and Pt collect below the anode in the form of. anodic mud.

2. Assertion: Reduction of a metal oxide is easier if the metal formed is in liquid state at the temperature of reduction.

Reason: The entropy is higher if the metal is in liquid state.

- a) If both assertion and reason are true and reason is the correct explanation of assertion.
- b) If both assertion and reason are true but reason is not the correct explanation of assertion
- c) If assertion is true but reason is false. d) If both assertion and reason are false
- 3. Which of the following compounds is used as the starting material for the preparation of potassium dichromate?
  - a) K<sub>2</sub>SO<sub>4</sub>.Cr<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>.24H<sub>2</sub>O (Chrome alum) b) PbCrO<sub>4</sub> (Chromite yellow) c) FeCr<sub>2</sub>O<sub>4</sub> (Chromite)
  - d) PbCrO<sub>4</sub>.PbO (Chrome red)
- 4. Potassium dichromate is prepared from
  - a) chromate obtained by the fusion of chromite ore with sodium carbonate in free access of air
  - b) pyrolusite which is fused with potassium hydroxide in the presence of air
  - c) iron pyrites by the fusion with potassium carbonate in presence of moisture d) none of these.

#### Solution: -

$$\begin{array}{c} \text{4FeCr}_2 \text{O}_4 + 8 \text{Na}_2 \text{CO}_3 + 7 \text{O}_2 \rightarrow \text{Chromiteore } 8 \text{Na}_2 \text{CrO}_4 + 2 \text{Fe}_2 \text{O}_3 + \text{SCO}_2 \\ \text{Chromiteore} & \text{Sodium chromate (yellow)} \\ 2 \text{Na}_2 \text{CrO}_4 + 2 \text{H} + \rightarrow \text{Na}_2 \text{Cr}_2 \text{O7} + 2 \text{Na} + \text{H}_2 \text{O} \\ \text{Na}_2 \text{Cr}_2 \text{O}_7 + 2 \text{KCI} \rightarrow \text{K}_2 \text{Cr}_2 \text{O}_7 + 2 \text{NaCI} \\ & \text{Potassium} \\ & \text{dichromate} \\ \end{array}$$

5. Which of the following is magnetite?

a) 
$$Fe_2CO_3$$
 b)  $Fe_2O_3$  c)  $Fe_3O_4$  d)  $Fe_2O_3 \cdot 3H_2O$ 

- 6. In electro-refining of copper, some gold is deposited as
  - a) cathode mud b) electrolyte c) anode mud d) cathode.

## Solution: -

In electro-refining of copper, the zinc, nickel a d iron remain in the solution, while gold is deposited a anode mud. The anode decreases in weight gradually.

7.	7. The metal oxide reacts with a The oxide is Gibbs energy change is	to metal and reducing agent isNet						
	a) reducing agent, oxidised, reduced, negative c) oxidising agent, reduced, oxidised, positive d) re							
8.	In the metallurgy of aluminium							
	c) oxidation state of oxygen changes in the reaction a	a) Al <sup>3+</sup> is oxidised to Al <sub>(s)</sub> b) graphite anode is oxidised to carbon monoxide and carbon dioxide						
	d) oxidation state of oxygen changes in the overall I re							
	shown below	reaction occurring at the anode or the overall reaction as						
	Atanode: $C+O^{2-} o \overset{2+2-}{C}O+2e^-; C+2\overset{2-}{O} o \overset{4}{C}$ At cathode: $Al^{3+}+3e^- o Al$	$CO_{2}^{+2-}+4e^{-}$						
	Overall reaction: $2AI_2O_3 + 3C  ightarrow 4AI + {2+ \ 2- \ 3}{CO_2}$							
9.	9. Which of the following is not a method of refining of many a) Electrolysis <b>b) Smelting</b> c) Poling d) Liquation							
	Solution : -							
	Smelting is a process used for reduction of oxide to co	onvert it into metal						
10.	<ul><li>10. Extraction of chlorine from brine is based on:</li><li>a) reduction b) displacement c) oxidation d) e</li></ul>	vapor <b>ation</b> .						
	Solution: - The extraction of chlorine from brine is based on oxid $2CI^- + 2H_2O \rightarrow 2OH^- + H_2 + CI^2$	ation.						
11.	11. Which of the following metals cannot be obtained by a a) Cr b) Na c) Ca d) Mg	electrolysis						
	Solution : -							
	Active metals can be obtained by electrolysis.							
12.	<ul><li>12. An ore of tin containing, FeCrO<sub>4</sub> is concentrated by</li><li>a) gravity separation b) magnetic separation c)</li></ul>	froth floatation d) leaching.						
	Solution : -							
	FeCrO <sub>4</sub> is magnetic and tin is non-magnetic hence it	can be separated by magnetic separation.						
13.	<ul><li>13. Zone refining is based on the principle that</li><li>a) impurities of low boiling metals can be separated b</li></ul>	y distillation						
	b) impurities are more soluble in molten metal tha							
	c) different components of a mixture are differently ad							
	d) vapours of volatile compound can be decomposed	in pure metal						
14.	14. The main difference between cast iron and pig iron is							
	<ul><li>a) cast iron is purest form ofiron while pig iron is impure</li><li>b)</li></ul>							
	cast iron has lower carbon content (3%) as compared to pig iron (4%) and is extremely hard and brittle							
	c)	and the programme of the control of						
	•	while cast iron does not contain any impurity and can be						
	d) cast iron is soft and malleable while pig iron is extre	emely hard and brittle						

#### Solution: -

Pig iron contains about 4% C and many other impurities like S, P Si and Mn. Cast iron is made by melting pig iron with scrap iron and coke. It has slightly lower carbon content (3%) and is extremely hard and brittle.

15. Assertion: In the metallurgy of aluminium, purified Al<sub>2</sub>O<sub>3</sub> is mixed with Na<sub>3</sub>AlF<sub>6</sub> or CaF<sub>2</sub>

Reason: Na<sub>3</sub>AIF<sub>6</sub> or CaF<sub>2</sub> lowers the melting point of mixture and increase its conductivity.

- a) If both assertion and reason are true and reason is the correct explanation of assertion.
- b) If both assertion and reason are true but reason is not the correct explanation of assertion
- c) If assertion is true but reason is false. d) If both assertion and reason are false
- 16. Below point 'A' FeO can .
  - a) be reduced by carbon monoxide only b) be reduced by both carbon monoxide and carbon
  - c) be reduced by carbon only d) not be reduced by both carbon and carbon monoxide

## Solution: -

Below point 'A' FeO can be reduced by carbon monoxide only as the curve of formation of CO<sub>2</sub> from CO lies below the oxidation curve of Fe.

- 17. The method of zone refining of metals is based on the principle of:
  - a) greater noble character of the solid metal than that of the impurity
  - b) greater solubility of the impurity in the molten state than in the solid
  - c) greater mobility of the pure metal than that of impurity
  - d) higher melting point of the impurity than that of the pure metal

#### Solution: -

Zone refining of metals is based on the principle that the impurities are soluble to greater extent in molten state than in the solid.

- 18. Which of the following is not an example of roasting?
  - a)  $2ZnS + 3O_2 \rightarrow 2ZnO + 2SO_2$  b)  $2PbS + 3O_2 \rightarrow 2PbO + 2SO_2$  c)  $2Cu_2S + 3O_2 \rightarrow 2Cu_2O + 2SO_2$
  - d)  $2Cu_2O + Cu_2S \rightarrow 6Cu + SO_2$

#### Solution: -

It is an example of auto-reduction in which unoxidised copper sulphide reduces copper oxide.

- 19. Which of the following is not a carbonate ore?
  - a) Dolomite b) Calamine c) Siderite d) Zincite

## Solution: -

Zincite is ZnO.

- 20. Which one of the following is true in electrolytic refining?
  - a) Impure metal is made cathode. b) Impure metal is made anode
  - c) Impure metal is made cathode and pure metal as anode d) Both electrodes must be of pure metal

# Solution: -

Impure metal is made the anode and a Solution containing a salt of the same metal is used as an electrolyte.

- 21. Sometimes it is possible to separate two sulphide ores by adjusting the proportion of oil to water or by using depressants. When a depressant NaCN is added to an ore containing ZnS and PbS, what is the correct observation?
  - a) NaCN prevents PbS from coming to the froth but allows ZnS to come with froth.
  - b) NaCN prevents ZnS from coming to the froth but allows PbS to come with froth
  - c) NaCN prevents frothing of both ZnS and PbS, hence no froth is formed.
  - d) NaCN does not act as depressant hence a mixture of PbS and ZnS is found in froth

- 22. Which of the following changes take place during roasting?
  - (i) Impurities are removed as their volatile oxides.
  - (ii) Ore is converted into its oxide.
  - (iii) Changes like oxidation, chlorination, etc. take place.
  - a) (i) and (ii) b) (ii) and (iii) c) (i) and (iii) d) (i), (ii) and (iii)
- 23. Cryolite and fluorspar are mixed with Al<sub>2</sub>O<sub>3</sub> during electrolysis for extraction of aluminium to
  - a) increase the mass of the reaction mixture b) get other products at anode like fluorine
  - c) lower the melting point and increase the conductivity of the electrolyte
  - d) reduce aluminium oxide by cryolite
- 24. Extraction of gold and silver involves leaching with CN<sup>-</sup> ion. Silver is later recovered by
  - a) Distillation b) Zone Refining c) Displacement with Zn d) Liquation

#### Solution: -

Ag and Au being less than reactive Zn.

Reaction:

$$4Ag + 8NaCN + 2H_2O + O_2$$

$$\xrightarrow{Leaching} 4Na[Ag(CN)_2] + 4NaOH$$
Soluble sodium dicynoargentate (I)

Again Na[Ag(CN)\_2] can be treated with Zn.

$$2Na[Ag(CN)_2] + Zn \xrightarrow{Displacement}$$

$$Na_2[Zn(CN)_4] + 2Ag \downarrow$$

- 25. In metallurgical process, aluminium acts as
  - a) an oxidising agent b) a reducing agent c) acidic flux d) basic flux.

#### Solution: -

Metals like Al, Na, K, Mg act as reducing agents in metallurgical processes

- 26. Sulphides ores are converted to oxides before reduction. This is explained on the basis of which of the following?
  - a) Sulphides cannot be reduced easily while oxides can be reduced easily
  - b) Sulphides decompose on reduction hence they are first converted to oxides.
  - c) Sulphide ores have higher melting points than oxides
  - d) Oxides are more stable than sulphides hence easy to reduce

#### Solution: -

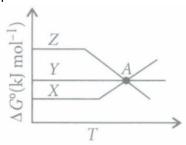

Thermodynamically based on Ellingham diagram it is observed that sulphides cannot be reduced easily as compared to oxides

- 27. Which of the following statements, about the advantage of roasting of sulphide ore before reduction is not true?
  - a) The  $\Delta G_f^0$  of the sulphide is greater than those for CS<sub>2</sub> and H<sub>2</sub>S.
  - b) The  $\Delta G_f^{^0}$  is negative for roasting of sulphide ore to oxide.
  - c) Roasting of the sulphide to the oxide is thermodynamically feasible
  - d) Carbon and hydrogen are suitable reducing agents for metal sulphides

#### Solution: -

Before reduction the Sulphide ore is roasted to oxide because the  $\Delta G_f^0$  of most of the sulphides are greater than those of CS<sub>2</sub> and H<sub>2</sub>S, therefore neither C nor H can reduce metal sulphide to metal. Further, the standard free energies of formation of oxide are much less than those of SO<sub>2</sub>. Thus oxidation of metal sulphides to metal oxide is thermodynamically favourable.

28. In the following Ellingham diagram, X, Y and Z represent graphs for metal oxides. Select the correct option before point A.

- a) Y will reduce oxide of Z. b) Ywill reduce oxide of X. c) Z will reduce oxide of X.
- d) Z will reduce oxide of Y

#### Solution: -

 $\triangle G^{o}$  of Y is less than Z.

- 29. Arrange the oxides of manganese according to increasing acidic strength.
  - a)  $MnO < Mn_3O_4 < Mn_2O_3 < MnO_2 < Mn_2O_7$  b)  $Mn_2O_7 < MnOz < Mn_2O_3 < Mn_3O_4 < MnO$

c) 
$$MnO_2 < Mn_2O_7 < Mn_3O_4 < Mn_2O_3 < MnO$$
 d)  $Mn_3O_4 < Mn_2O_3 < Mn_2O_7 < MnO_2 < MnO$ 

## Solution: -

Acidic strength of oxides of transition metals increases with increase in oxidation number.

$$\stackrel{+2}{M}nO,\stackrel{+8/3}{M}n_3O_4,\stackrel{+4}{M}nO_2,\stackrel{+7}{M}n_2O_7$$

Hence acidic strength is of the order of

 $MnO < Mn_3O_4 < Mn_2O_3 < MnO_2 2O_7$ 

(Basic) (Amphoteric) (Acidic)

30. In the extraction of copper from its sulphide ore, the metal finally obtained by the reduction of cuprous oxide with

a) Iron (ii) sulphide b) Carbon monoxide c) Copper (i) sulphide d) Sulphur dioxide

## Solution: -

Reaction:

$$2Cu_2 S(s) + 3O_2(g) \longrightarrow 2Cu_2O(s) + 2SO_2(g)$$

The unchanged Cu<sub>2</sub>S, reacted with Cu<sub>2</sub>O and heated shongly in absence of air.

Thus 
$$2Cu_2 S \rightarrow 2Cu_2O + 6Cu + SO_2$$

31. Which of the following metals cannot be obtained by reduction of its metal oxide by aluminium?

## Solution: -

Since reduction potential of Al is more than that of Mg and less than other given metals. So it cannot reduce Mg from its oxide

- 32. Blister copper obtained during extraction from cuprous oxide is called so because
  - a) it has blister like eruptions due to evolution gas. b) it has a shining surface like blister
  - c) it is the most impure form of copper d) its surface is uneven due to different thickness at different places

#### Solution: -

Solidified copper obtained is called blister copper since it has blistered appearance due to the evolution of sulphur dioxide gas.

$$2Cu_2O + Cu_2S \rightarrow 6Cu + SO_2$$

- 33. Which one of the following elements constitutes a major impurity in pig iron?
  - a) Silicon b) Oxygen c) Sulphur d) Graphite

#### Solution: -

Graphite produces impurity in pig iron.

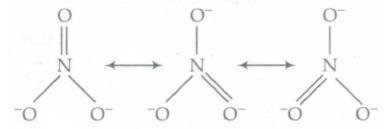

34. Four metals and their methods of refinement are given,					
	Ni, Cu, Zr, Ga ) electrolysis, van Arkel process, zone refining, Mend's process hoose the right method for each				
	Ni: Electrolysis, Cu : van Arkel process, Ni : Monds process, Cu : Electrolysis,				
	a) Zr : Zone refining, Ga : Mend's process b) Zr : van Arkel process, Ga : Zone refining				
	Ni : Monds process, Cu : van Arkel process, Ni: Electrolysis, Cu : Zone refining,				
25	c) Zr : Zone refining, Ga : Electrolysis d) Zr: van Arkel process, Ga : Mend's process				
<i>ა</i> 5.	Which of the following metal evolves hydrogen on reacting with cold dilute HNO <sub>3</sub> ? <b>a) Mg</b> b) Al c) Fe d) Cu				
	Solution:				
	Magnesium react with cold and dilute nitric acid to form hydrogen				
	$ ext{Mg} + 2 ext{HNO}_3 \longrightarrow  ext{Mg(NO}_3)_2 +  ext{H}_2$				
36.	Which of the following statements, about the advantage of roasting of sulphide ore before reduction is not true?				
	a) Carbon and hydrogen are suitable reducing agents for metal sulphides				
b) The $\Delta_f$ G <sup>0</sup> of the sulphide is greater than those for CS <sub>2</sub> and H <sub>2</sub> S					
	c) The $\Delta_f$ G <sup>0</sup> is negative for roasting of sulphide ore to oxide				
d) Roasting of the sulphide to the oxide is thermodynamically feasible					
	Solution : - Carbon and hydrogen are not suitable reducing agents for metal sulphides.				
37	Which process of purification is represented by the following reaction?				
01.	$Ti \atop Immure + 2I_2 \stackrel{250^{\circ}C}{} TiI_4 \stackrel{1400^{\circ}C}{$				
	$egin{aligned} Iii &+2I_2 -\!$				
	a) Zone refining b) Monds process c) Cupellation d) van Arkel process				
38.	Which of the following is a halide ore?				
	a) Cassiterite b) Anglesite c) Siderite d) Carnallite				
	Solution: -				
20	Carnallite is KCI·MgCl <sub>2</sub> ·6H <sub>2</sub> O.				
39.	The significance of leaching in the extraction of aluminium is:  a) it helps removing the impurities like SiO <sub>2</sub> , Fe <sub>2</sub> O <sub>3</sub> , etc from the bauxite ore				
	b) it converts the ore into oxide c) it reduces melting point of the ore d) it eliminates water from bauxite.				
40.	"Metals are usually not found as nitrates in their ores." Out of the following two (I and II) reasons which is/are true				
	for the above observation?				
	I. Metal nitrates are highly unstable				
	II. Metal nitrates are highly soluble in water.				
	a) I and II are true b) I and II are false c) I is false but II is true d) I is true but II is false				

Metals are not found as nitrates in their ores because metal nitrates are highly soluble in water. e.g., KNO<sub>3</sub>

Solution: -

dissociates as  $KNO_3 \rightleftharpoons K^+ + NO_3^-$ 

The nitrate anion has three equivalent oxygen surrounding a central nitrogen atom. This tends to spread the single negative charge and make it easier for water to separate the ions in solution.

- 41. The powdered ore is agitated with water or washed with running stream of water. The heavy ore particles and lighter impurities are separated. This method of concentration is known as
  - a) metallurgy b) leaching c) gravity separation d) froth floatation process
- 42. During a column chromatography through Al<sub>2</sub>O<sub>3</sub> column, a mixture of components A, B and C is passed through the column. On adding eluant, compound 'A' is eluted first then 'B' and in the end 'CO Which of the following statements regarding the components is correct.
  - a) The order of adsorption of A, B and C is C>B>A. b) The order of adsorption of A, B and C is A>B>C.
  - c) The order of adsorption of A, B and C is B>A>C. d) The order of adsorption of A, B and C is B>C>A.

## Solution: -

Since compound 'A' comes out before 'B', 'B' is more readily adsorbed to the column and 'B' comes out before 'C, hence 'C' is more readily adsorbed than 'B: Hence, the order of adsorption is C > B > A.

43. Match the column I with column II to match the method of extraction and mark the appropriate choice

Co	olumn	lumn-lColumn-ll		
Α	Cu	(i)	Direct reduction of sulphide by heating	
В	Sn	(ii)	Electrolysis of fused chloride and fluoride	
С	Hg	(iii)	Partial oxidation of sulphide ore	
D	Ca	(iv)	Reduction of oxide with carbon	

a) (A) 
$$\rightarrow$$
 (iii), (B)  $\rightarrow$  (i), (C)  $\rightarrow$  (ii), (D)  $\rightarrow$  (iv) b) (A)  $\rightarrow$  (iii), (B)  $\rightarrow$  (iv), (C)  $\rightarrow$  (i), (D)  $\rightarrow$  (ii)

$$c) \; (A) \rightarrow (i), \; (B) \rightarrow (iii), \; (C) \rightarrow (ii), \; (D) \rightarrow (iv) \quad \; d) \; (A) \rightarrow (iv), \; (B) \rightarrow (i), \; (C) \rightarrow (ii), \; (D) \rightarrow (iii)$$

44. Assertion: Chromatography in general involves a mobile phase (a gas, a liquid or a supercritical fluid) and a stationary phase (like Al<sub>2</sub>O<sub>3</sub> column).

Reason : A component which is less soluble in stationary phase takes longer time to travel through it than the component which is more soluble in stationary phase

- a) If both assertion and reason are true and reason is the correct explanation of assertion.
- b) If both assertion and reason are true but reason is not the correct explanation of assertion
- c) If assertion is true but reason is false. d) If both assertion and reason are false

#### Solution: -

A component which is quite soluble in the stationary phase, takes longer time to travel throug it than a component which is not very soluble in the stationary phase but very soluble in the mobile phase

45. During the formation of the slag by the reaction of flux and impurities which of the following is an example of acidic and basic flux?

$$FeO + SiO_2 \rightarrow FeSiO_3$$

$$SiO_2 + MgO \rightarrow MgSiO_3$$

- a) (i) SiO<sub>2</sub> Acidic flux (ii) MgO Basic flux b) (i) SiO<sub>2</sub> Basic flux (ii) MgO Acidic flux
- c) (i) SiO<sub>2</sub> Basic flux (ii) MgO Basic flux d) (i) SiO<sub>2</sub> Acidic flux (ii) MgO Acidic flux

# Solution: -

(i) $FeO_{Basic\ impurity} + SiO_2  ightarrow FeSiO_3$
(ii) $SiO_2 + MgO  ightarrow MgSiO_3 \ _{Acidic\ impurity} + _{Bsic\ Flux} Slag$
. Why is partial roasting of sulphide ore done
a) Auto-reduction of Cu-O formed is carri
b) Cu is separated out by partial reduction d
\D

- 46 e in metallurgy of copper?
  - ried out by remaining CU<sub>2</sub>S in the reaction.
  - due to sedimentation.
  - c) Due to difference in gravity Cu<sub>2</sub>O and CU<sub>2</sub>S are separated.
  - d) Complete roasting cannot be done in one step hence partial roasting is done

#### Solution: -

Partial roasting of sulphide ore forms some oxide. This oxide then reduces the remaining sulphide ore into metal.

$$2\mathsf{Cu}_2\mathsf{S} + 3\mathsf{O}_2{\rightarrow} 2\mathsf{Cu}_2\mathsf{O} + 2\mathsf{SO}_2$$

$$2Cu_2O + Cu_2S \rightarrow 6Cu + SO_2$$

This process is called auto reduction.

- 47. Cassiterite is an ore of:
  - a) Mn b) Ni c) Sb d) Sn

## Solution: -

Cassiterite is an ore of Sn with chemical composition SnO<sub>2</sub>.

- 48. Sulphide ore of zinc/copper is concentrated by
  - a) floatation process b) electromagnetic process c) gravity separation d) distillation.
- 49. Mark the correct statements
  - (i) Mercury can be refined by the process of distillation.
  - (ii) In poling, the molten impure metal is stirred with green poles of wood.
  - (iii) In electrolytic refining of metals, impure metal is made as cathode and a thin strip of pure metal is made as anode
  - a) (i) and (ii) b) (i) and (iii) c) (ii) and (iii) d) (i), (ii) and (iii)

#### Solution: -

In electrolytic refining of metals, impure metal is made as anode and a thin strip of pure metal is made as cathode.

50. Removal of the unwanted materials like sand, clays etc. from the ore is known as

- a) concentration, dressing, benefaction b) separation, refining, gangue
- c) magnetic separation, purification, gangue d) washing, refining, amalgamation
